CONCRETE + CRAFT

CAPABILITY STATEMENT

Some architecture asks more of its concrete. More precise geometry, more demanding structures and a finer standard of finish. This collection offers a closer look at the work behind those ambitions.

Sculptural

Circular openings punctuate an off-white concrete roof, bringing sky and planting into the composition. Their precise radii give the canopy the calm, deliberate quality of a sculpted object.

Bare

A quiet surface can be the strongest architectural gesture.
Here, the concrete ceiling needs little embellishment. Its scale,
finish and circular aperture give the space its definition.

Every Line Matters

The concrete's apparent simplicity begins with a rigorous set-out. Panel lines were planned for symmetry, allowing edges and junctions to read as deliberate parts of the architectural composition.

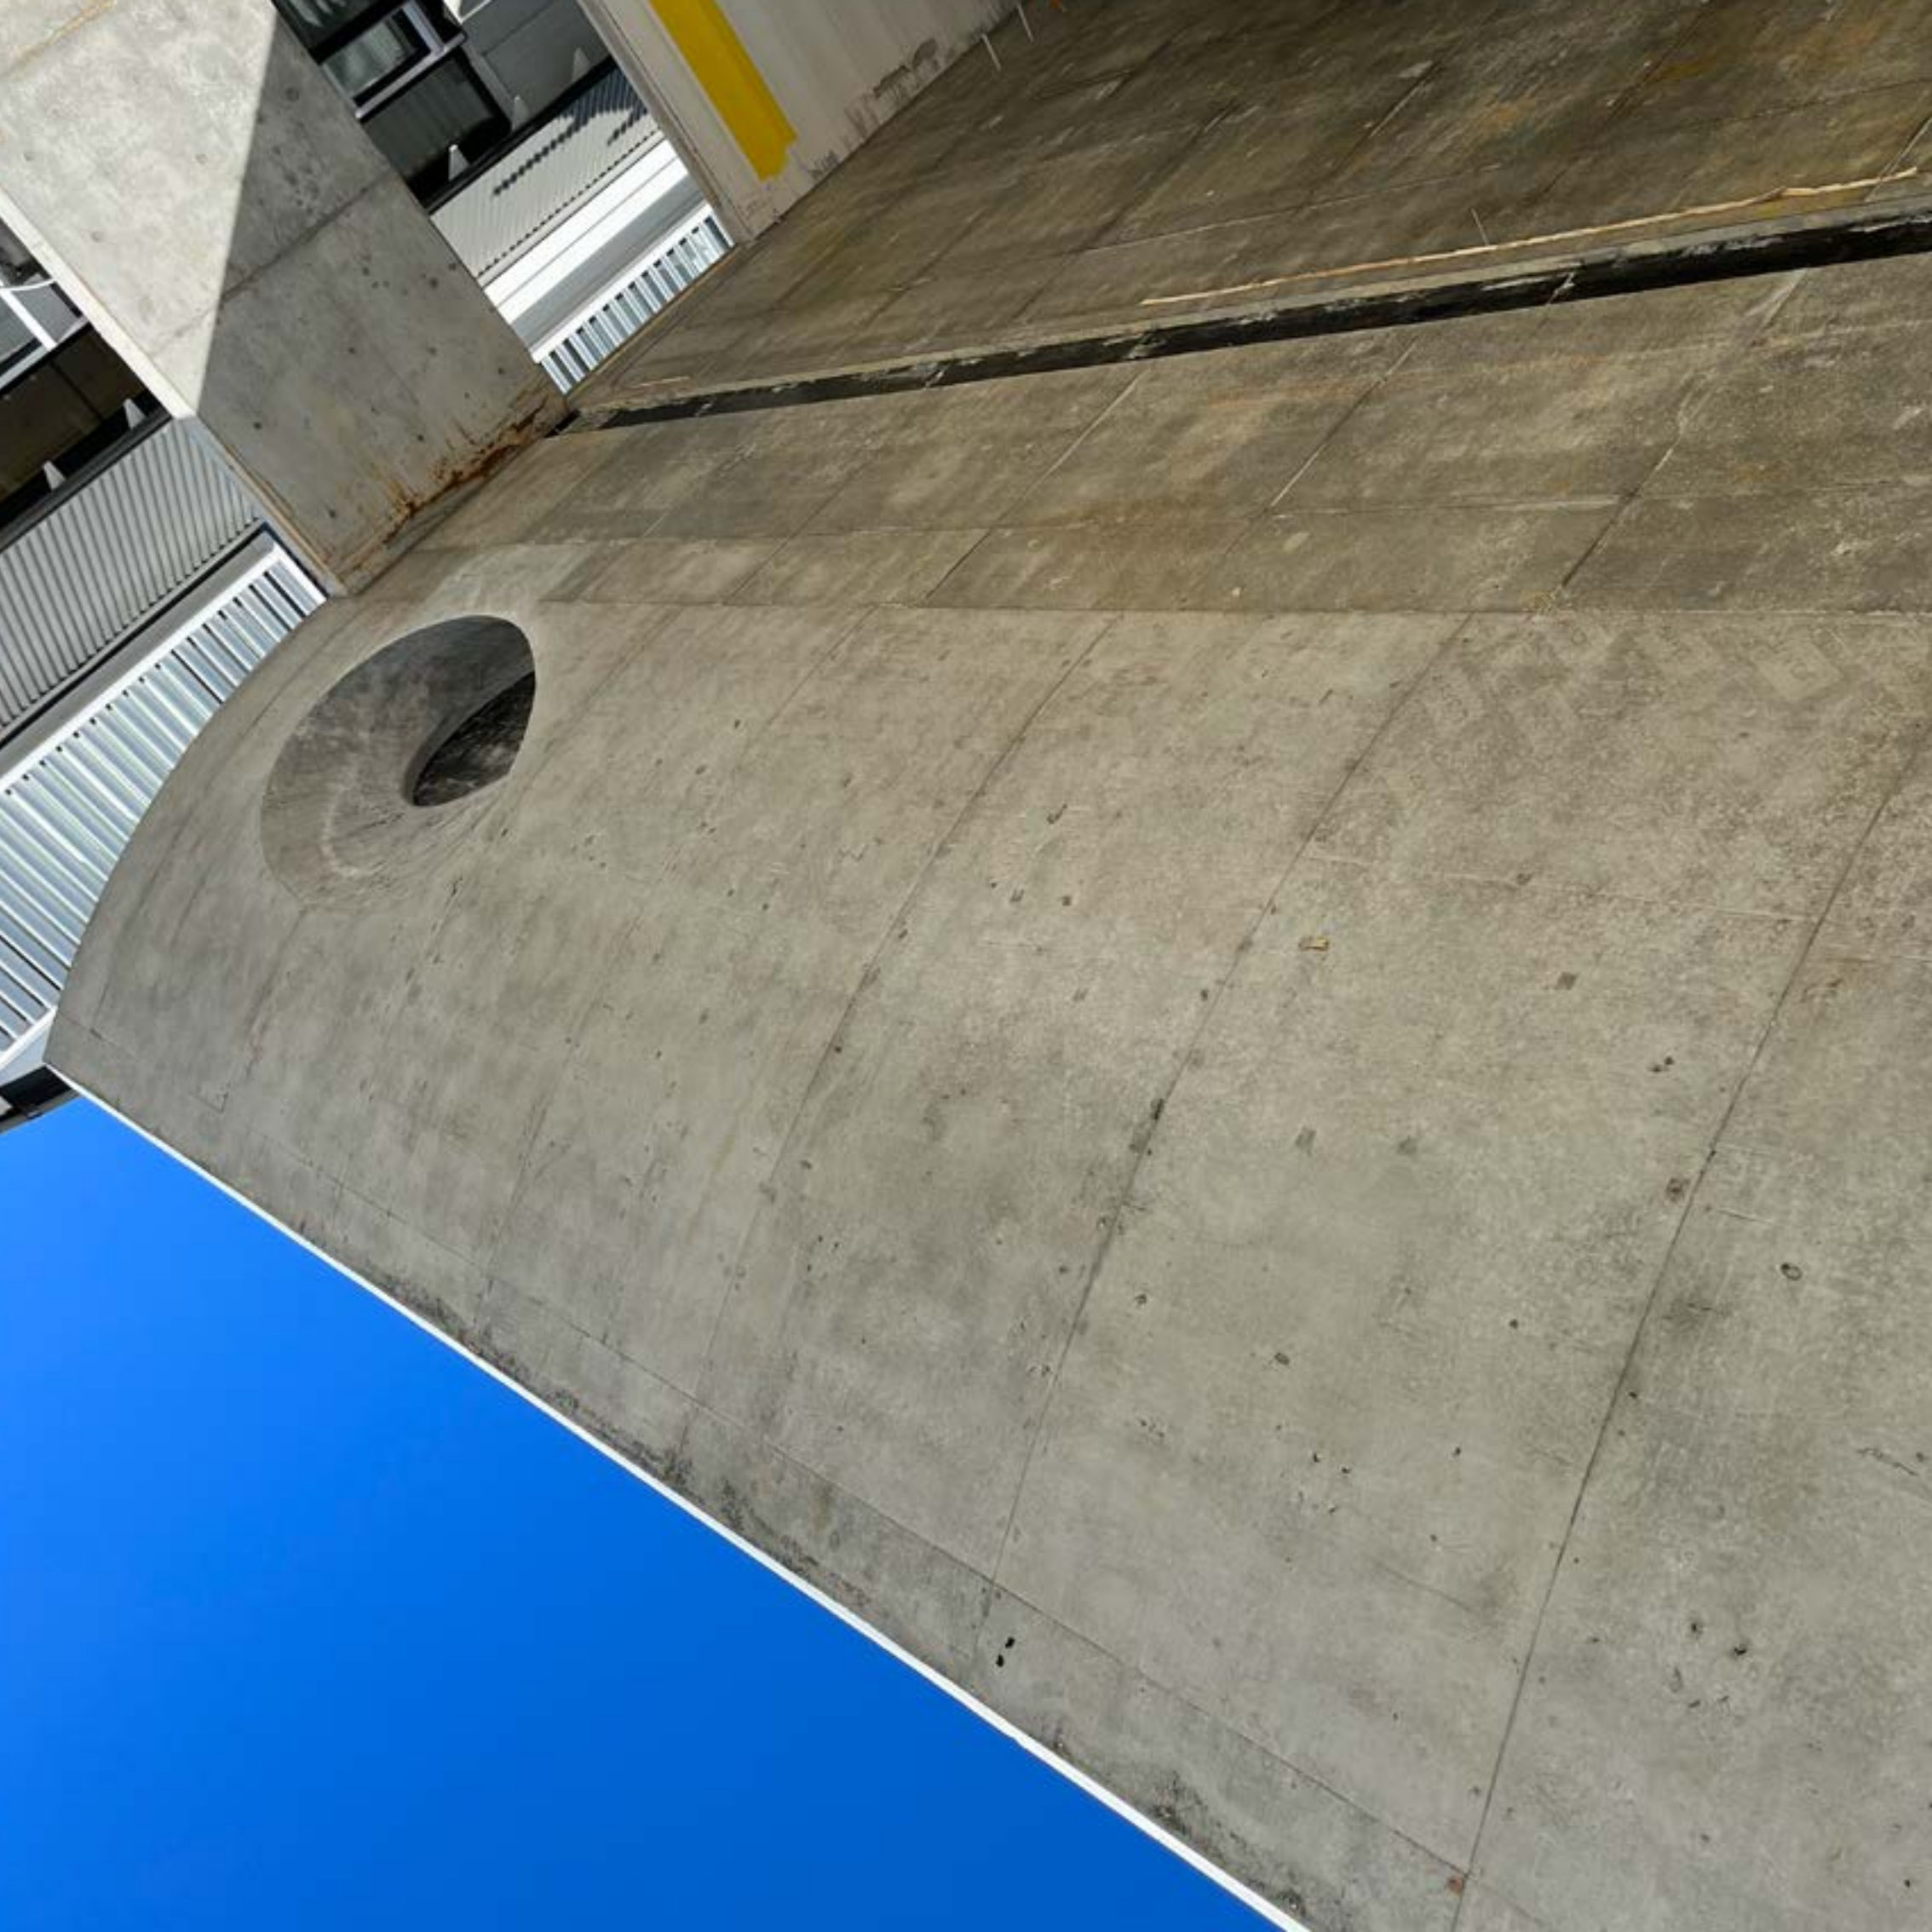

Detail at Scale

A large footprint magnifies every inconsistency. On work of this scale, the achievement lies in carrying accuracy and control across the entire structure, not simply in perfecting its most visible details.

Considered

Some of the most important decisions remain invisible. On this intricate structure, coordination across trades and millimeter-level control allowed a demanding sequence of arches to take shape.

Architectural Emphasis

A circular opening interrupts the mass of a curved concrete roof. Blackform formed the surrounding structure, retaining the roof's geometry and the exposed concrete character that makes it such a strong architectural feature.

Character Emphasis

The apparent ease of the curve belies the care beneath it.
Formwork shaped from the architectural dimensions allowed
the designed radius to carry through to the finished concrete.

Impeccable Standard

The quality of a finished surface depends on work that disappears. Each rib, junction and supporting brace was resolved so the concrete could follow a clean, uninterrupted line.

Our Standard

One material, three treatments. The ceiling carries the imprint of its formwork, the column has a refined patched finish, and the fireplace plinth was finished by hand while the concrete was still workable.

Presence

A structure of this scale calls for judgment as much as workmanship. Blackform's contribution extended into construction planning and technical coordination, helping the project team address a complex design with significant structural and site constraints.
